

Events

Daterangepicker triggers a number of events in certain circumstances. All events have extra data attached to the event object that is passed to any event handlers

```
$('.datepicker').datepicker()  
  .on(picker_event, function(e) {  
    // `e` here contains the extra attributes  
  });
```

- `date`: the relevant Date object, in local timezone. For a multigate picker, this will be the latest date picked.
- `dates`: an Array of Date objects, in local timezone, when using a multigate picker.
- `format([ix], [format])`: a function to make formatting `date` easier. `ix` can be the index of a Date in the `dates` array to format; if absent, the last date selected will be used. `format` can be any format string that datepicker supports; if absent, the format set on the datepicker will be used. Both arguments are optional.

show

Fired when the date picker is displayed.

hide

Fired when the date picker is hidden.

clearDate

Fired when the date is cleared, normally when the “clear” button (enabled with the `clearBtn` option) is pressed.

changeDate

Fired when the date is changed.

changeMonth

Fired when the *view* month is changed from year view.

changeYear

Fired when the *view* year is changed from decade view.

changeDecade

Fired when the *view* decade is changed from century view.

changeCentury

Fired when the *view* century is changed from millennium view.
